Energy Storage: The system features a flywheel made from a carbon fiber composite, which is both durable and capable of storing a lot of energy. A motor-generator unit uses electrical power to spin the flywheel up to high speeds. As it spins, the flywheel accumulates kinetic energy, similar to how a spinning top holds energy. ...

Flywheel energy storage (FES) works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy. The energy is converted back by slowing down the flywheel. Most FES systems use electricity to accelerate and decelerate the flywheel, but devices that directly use mechanical energy are being developed.
