

Iran net zero energy buildings

Can net zero energy redefining sustainable architecture in Iran?

This paper introduces an innovative approach that combines Net Zero Energy (NZE), Net Zero Carbon (NZC), and Regenerative principles, redefining sustainable architecture in Iran. Focusing on a residential "attached house," the study employed strategies like thermal insulation, Low-E glass, shading, and renewable energy sources.

What is a net zero building?

Applying this US Government Net Zero classification system means that every building can become net nero with the right combination of the key net zero technologies - PV (solar), GHP (geothermal heating and cooling, thermal batteries), EE (energy efficiency), sometimes wind, and electric batteries.

What is a net-zero energy building (NZEB)?

Today,one of the useful methods to reduce energy consumption and greenhouse gas emissions in the building sector is the design of a Net-zero Energy Building (NZEB),which has been noticed in recent years. For example,the United States of America has passed a law that by 2050,all buildings must be Near Zero Energy Buildings(NZEB).

How to achieve a net-zero energy building?

To achieve a net-zero energy building, solar panels are utilized, along with recyclable materials to attain a carbon-neutral structure. The details of wall layering are given in Appendix A of Table A.1. Table 1. Strategies employed to achieve the desired building (source: Author). 3.2.

Can solar energy be used to build a zero-energy building?

The obtained results showed that with the efficient use of renewable energy, it is possible achieve a zero-energy building in Morocco (Abdou et al. 2021). Also, in 2014, Eshraghi et al. studied the potential of using solar energy in the design of a zero-energy building in Tehran.

What is a zero-energy building?

The zero-energy building concept has been a progressive evolution from other low-energy building designs. Among these,the Canadian R-2000 and the German passive house standards have been internationally influential.

Advantages of net-zero energy buildings included a reduction in thermal fluctuations in these buildings, which results from adequate isolation and well provides the comfort conditions; ...

2016). Therefore, it is theoretically possible to design a zero-energy building in Iran. Zero-energy building design The feasibility of a zero-energy building design in Oman (a very hot climate) ...

Iran net zero energy buildings

The present research evaluated the feasibility of net-zero energy residential buildings in southern Iran using a distinct framework. To this end, a low-energy and simulated model of a multi-family residential building as the dominant ...

The climate-adaptive net-zero energy building design is an effective trend for achieving a carbon-neutral environment and reducing global energy demand, especially, in India where building energy consumption recorded substantial growth in the past decade. This review article focuses on the development of net-zero energy buildings in tropical ...

The present research evaluated the feasibility of net-zero energy residential buildings in southern Iran using a distinct. ... Zero Energy Building in Iran. Energy Procedia. 18(C): 652-658. ...

A few studies have been conducted on thermal satisfaction of net-zero energy buildings prior to this date; one of the objectives of the present study is to draw a comparison between the thermal ...

Energy efficiency improvement in Chinese construction has progressed rapidly over the past two decades. Nearly zero energy buildings (NZEBs), as an integrated solution for energy-efficient construction, have gained significant attention during China's 13th Five-Year Plan period, with continuous maturation of the technical system. In this study, a research framework ...

Net Zero Energy Building (NZEB) Rating is applicable to Commercial, Industrial as well as Residential building projects those are able to off-set 100% annual grid energy use by renewable energy sources (either on-site and or off-site). These buildings include but not limited to offices, banks, IT parks, shopping malls, hotels, hospitals ...

In recent years, the concept of net zero energy buildings (NZEBs) has become a potential plausible solution to improve efficiency and reduce energy consumption in buildings. To ...

To cope with "Post-2020", each country set its national greenhouse gas (GHG) emissions reduction target (e.g., South Korea: 37%) below its business-as-usual level by 2030. Toward ...

Globally, the building sector constitutes one of the three major carbon-emitting sectors (along with transportation 1 and industry 2). Among those three, buildings have the highest energy demand share (approximately 35%). 3 Although building energy activity declined (over 3%) in 2020 during the COVID-19 pandemic, 2021 ushered in a rebound as building activity in ...

The Net Zero Energy Building (NZEB) is an alternative to this alarming pollution. With its reduced energy needs and renewable energy systems, a ZEB can return as much energy as it takes from the utility on an annual basis. ... Zero Energy Building, Green building, Iran climate, Energy optimization, Reducing energy consumption, clean Energy. 1 ...

Iran net zero energy buildings

Using hydrogen energy as energy storage of an off-grid zero energy building in Iran by considering occupant thermal comfort using the fanger model has been presented for the first time in this ...

The minimum energy price to make NZEB cost-effective depends on the efficiency of renewable energy generators (REGs) of the building, and the building's energy consumption, which are ...

The majority of energy consumption is attributed to buildings. Buildings designed with environmentally sustainable features have the potential to reduce energy consumption. ...

Advantages of net-zero energy buildings included a reduction in thermal fluctuations in these buildings, which results from adequate isolation and well provides the comfort conditions; energy supply, even in the event of shutting down in the global energy distribution network; protection against the everincreasing rise in energy prices ...

Recent advancements in Net-Zero Energy Buildings (NZEBs) in Iran demonstrate the effective integration of active and passive strategies for enhanced energy efficiency and sustainability across various climates. In the hot and humid climate of Bushehr, a 2022 study by Mohammadi and Mousavi shows significant energy savings through the use of ...
