Can micro inverters be used in off grid solar power systems?

With the growth in the use of micro inverters, I'm starting to get more and more emails asking: can micro inverters be used in off grid (or hybrid) solar power systems? The short answer is yes they can! In fact a number of micro inverter battery backup systems are already operating here and abroad.

Can a micro inverter be used as an AC source?

It's not simple but it absolutely does work and has been gaining favour as a solution for many years. So, logically micro inverters that present solar as an AC source can indeed be coupled into these types of systems. In the last 2 block diagrams above you simply swap out the solar panel and grid tie inverter for all your AC solar panels.

How do I decouple a microinverter from a battery?

It depends on the MPPT controller, but in general, this is true. Putting a lossy power resistor in series with each MPPT will decouple them somewhat as well. Here's another way, if it's a 48V battery. Get a 48V charge controller and connect the input to your panels and the output to the microinverter and the battery.

Can a micro inverter battery backup system work?

The short answer is yes they can! In fact a number of micro inverter battery backup systems are already operating here and abroad. The longer answer gets a bit technical - but I'll try to keep it as simple as I can!

What is a smarter micro inverter?

Recently however, Enphase announced a new generation of smarter micro inverters, which will effectively allow them to make many of the traditional components of an AC coupled system redundant by embedding more of the control and power conversion functions of the inverter/charger into the micro inverter itself.

How do you charge a microinverter with a 48v battery?

Here's another way, if it's a 48V battery. Get a 48V charge controller and connect the input to your panels and the output to the microinverter and the battery. It could make a nice AC-coupled battery with my Hoymiles inverters.

The off-grid inverter draws the power from a battery, converts it from direct current, and outputs alternating current. Regular inverters have to supply the power they convert from DC to AC instantly to the appliance. The energy must quickly react, be over, and up to the inverter's capacity rating.

The ideal battery usage time for an application generally depends on the power stability in the region where it will be used. For instance, in a region with stable electricity, engineers might want to size their inverters ...

Not without using another battery inverter. Eg you can use a Victron Multiplus, and if you install it correctly the power from the microinverters will be used to charge the battery. Most micro-inverters can't be used if the grid is down, not even with a backup inverter such as the Multiplus, because they don't support frequency shifting.
