

Saint Pierre and Miquelon n type back contact solar panel

What is a n-type solar panel?

The emitter layer for the cell is negatively doped (N-type), featuring a doping density of 10^{19} cm^{-3} and a thickness of 0.5mm. N-type solar panels are an alternative with rising popularity due to their several advantages over the P-type solar panel.

What makes p-type and n-type solar cells different?

To summarize, the main aspect that makes P-type and N-type solar cells different is the doping used for the bulk region and for the emitter.

What is BC back-contact n-type?

Home » Solar Modules » BC Back-Contact N-Type Ultra smooth, ultra efficient: thanks to the groundbreaking combination of N-Type and Back-contact (BC) cell technology, the newest AEG solar modules can reach up to 23.6% efficiency and generate higher outputs (ca. 15% more power compared to standard solar modules).

Are back-contact solar modules sustainable?

The Back-contact solar modules are further more sustainable by design thanks to the silverless cell construction. Last but not least: the innovative cell technology allows for longer performance warranties (30 years).

Are n-type solar panels better than P-type?

N-type solar panels currently have achieved an efficiency of 25.7% and have the potential to keep on increasing, while P-type solar panels have only achieved an efficiency of 23.6%. Manufacturing costs represent one of the few disadvantages of N-type solar panels.

Why is n-type silicon a good choice for solar panels?

The N-Type silicon's structure is inherently less susceptible to LID, thanks to its negative charge that stems from the phosphorus doping. This characteristic ensures that solar panels retain their initial efficiency levels for a longer duration, enhancing the overall energy yield and reliability of solar installations.
