2) If you charge a battery and leave it in the charger, you can deplete battery memory, and it will eventually die. The super capacitor will STOP accepting any energy once it is full. 3) The internal ESR (Internal resistance) is extremely small in a super capacitor. We're talking 0.01 Ohms or less.

Alternatively, supercapacitors are designed specifically to deliver energy very quickly, making them perfect complements to batteries. While batteries can provide ~10x more energy over much longer periods of time than a supercapacitor can (meaning they have a higher specific energy), supercapacitors can deliver energy
