Can service stacking improve energy storage system integration?

Service stacking is a promising method to improve energy storage system integration. There are several interesting cases where service stacking is crucial. Frequency supportive services are the most common to add when expanding portfolios. There is no standard method to solve optimization of service portfolios.

Is service stacking a good investment?

To ensure that an energy storage investment is guaranteed a reasonable payback period and a good return of investment it is advantageous to consider the possibility of service stacking. By offering additional services in turns or in parallel with the main service it is possible to create important revenue streams.

Why is value stacking important?

However, when multiple use cases are satisfied concurrently, the associated "value stacking" can significantly improve the economics and return on investment. Value stacking is defined as the bundling of grid applications, creating multiple value streams, which can improve the economics for distributed energy resources.

Is service stacking a good option for storage units?

Storage units that are operating mainly for a service with large seasonal variation, service stacking has a great potential to be implemented. RES integration and T&D investment deferral are two examples of such services which both include large annual variations.

What is the optimal ESS for service stacking?

From the reviewed literature the "optimality" approach varies frequently between the two cases with a majority of objective functions maximizing profit as main target. From the review it is found that the typical ESS used for service stacking is a 1C storage with approx. 1 MW/1 MWh rated power and energy capacities.

Is service stacking a good idea for a power demanding main service?

The opposite is valid for a power demanding main service. One interesting approach is to consider service stacking already during the dimensioning process. This approach requires an optimization of the storage size given the specified portfolio, accounting for all relevant services included.

When energy storage and smart devices are used to control solar energy that is generated, it helps to create a smarter, more interactive grid, in which supply and demand is managed, instead of it ...

Historically, BESS has been used for one or two high-power ancillary services in the Nordics, but with changing market dynamics, BESS owners should explore dynamic revenue value stacking in more energy-intensive frequency markets, in wholesale electricity trading, and through participation in local flexibility markets in order to maintain their ...

This limited understanding of DER is just one of the factors preventing DER accessing the full value stack. Other elements include the limited availability of integrated "smart DER" products to maximise the potential of passive DER, emerging distribution network constraints, the lack of clear price signals, as well as legacy market ...

This multi-use approach to energy is known as value-stacking. For example, a BESS project can help defer the need for new transmission by meeting a portion of the peak demand with stored energy during a select few hours in the year.

Brattle conducted models and simulations using a 1-MW battery -- which provides four hours of storage -- and estimated the comprehensive savings associated with "stacking" battery storage uses, or operating batteries to capture the benefits from a number of value streams. Energy storage advocates say stacking is critical to take advantage ...
